

“WHO WANTS WHIZZ?..”

“Who wants Glucose? Who wants Bicarbonate of Soda? Who wants crushed up Paracetamol?.. Who wants Epsom Salts?... You name it we'll call it Whizz and charge you £10 a wrap for it!... C'mon roll up...roll up!”

Amphetamine Sulphate ('Whizz') is rarely more than 5% pure when it's sold on the streets.

Because it's riddled with rubbish it is very dangerous to inject or sniff it.

Whizz has a built in tolerance.

As you get used to it you need more and more to get less and less.

Whizz is a 'big dipper drug'. It takes you up and then dumps you down.

“The bigger the dip... The bigger the dump!”
When you're whizzing you forget how much alcohol you're drinking. This makes you come down even worse!

REMEMBER:

Take too much Whizz too often and your phone will soon stop ringing.

“I mean, who wants to be around a depressed, moody, irritable bore?”

COCAINE POWDER and ROCK COCAINE

COCAINE POWDER (Cocaine Hydrochloride) is a shorter acting stimulant drug than Whizz (Amphetamine Sulphate).

It's also much more expensive than Whizz. Like Whizz it is always tempting to use more and more to get less and less.

ROCK COCAINE is cocaine powder 'washed up' into rocks so that it can be smoked.

Rock Cocaine is much shorter acting stimulant than cocaine powder.

The 'buzz' off rocks is measured in minutes not hours.

Rock Cocaine is the biggest meanest, dipper of them all. It takes you higher than anything else and dumps you much lower, much quicker.

Rocks are not dance drugs!

Any fun soon wears off and leaves you wanting more.

More is going to cost you plenty! Riding on the Rock Cocaine 'big dipper' can cost you a fortune and leave you mad, bad and desperate.

REMEMBER:

People use HEROIN to come off Rock Cocaine!

THINK ABOUT THAT ONE!

POPPERS

Poppers are:

- liquid in little bottles
- called 'Rush', 'Ram', 'Liquid Gold' etc
- sniffed up the nose
- used to get a fast energetic buzz
- used to lower sexual inhibitions
- used to intensify orgasm
- legal in the U.K.
- from a family called 'nitrates'
- cheap to buy from sex shops, clubs and even joke shops

BUT POPPERS ARE NOT A RISK FREE JOKE.

REMEMBER:

Poppers cause headaches, nausea, coughing and dizziness. Poppers are very caustic and will cause burning and blisters if spilt on skin, so NEVER drink them.

The rush from sniffing Poppers is dangerous for people with heart diseases and /or blood pressure problems. These people should avoid Poppers if they don't want to pop off.

ACID/'TRIPS'/LSD – “WHAT TIME IS IT?”

Acid is a mental drug. . .it's all in the mind. When trips start to work they change the way you see, feel and think about the world around you.

People and things seem different. Acid changes everyday reality into something else.

This can be interesting and funny. It can also be confusing and frightening.

There is a big difference between a mild trip and a strong one.

Strong trips are not just about giggles, colours and pretty pictures.

The stronger the acid the greater the distortion in everyday reality.

Hours can pass by in minutes and a minute can take forever.

REMEMBER:

Trips last a long time (8hrs)

Watch *who* you take it with and *where* you take it.

You should be relaxed and with people you trust.

If things go wrong ('a bad trip') it feels like it will never end. But it will!

If a friend is on a bad one be calm and reassure them that everything will be o.k. talk them down till they relax back into the trip.

People with a history of any kind of mental illness should stay away from LSD.

“WHAT’S THAT?..... WHAT’S WHAT?”

That’s a good question.....

There are at least 172 chemicals between trips and whizz. It’s a bit like a rainbow.

At one end you’ve got L.S.D. (‘Trips’). At the other end you’ve got amphetamines (‘Whizz’).

LSD/‘Trips’

In between you’ve got that large number of drugs that combine psychedelic (‘Trippy’) effects and the stimulant (‘Speedy’) effects of Whizz.

‘Ecstasy’ (MDMA) is one of those drugs that has both speedy and trippy effects. ‘Eve’ (MDEA) is another. Both of these drugs are short acting compared to the parent drug MDA which can last for up to 12 hours. MDMA, MDEA and MDA are all commonly sold as ‘E’. One of the biggest problems is that there are a lot of tablets and capsules that are sold as ‘E’ that aren’t on any rainbow. You can very easily pay £15 for a dog worming tablet or an anaesthetic drug like ketamine or P.C.P.

“It can be a mean old scene bud!”
and **REMEMBER THIS:**

- * LSD/‘TRIPS’ are Class A drugs
- * MDA/MDMA/MDEA/‘E’s are Class A drugs
(the same as Heroin and Cocaine)
- * AMPHETAMINE/‘WHIZZ’ is a Class B drug
(the same as Cannabis/Draw)

If you are caught dealing drugs
you’re looking at jail – be warned!

Warning... Warning... Warning
...HOT!...HOT!...HOT!...HOT!...

*** Dancing, Drinking and taking Drugs when it's dead dead hot!**

When you take any stimulant drug (Ecstasy, Whizz, Cocaine) your body temperature rises. When you take stimulants in a hot place (a club) your body temperature rises even more.

Take these drugs in a hot place *and* start dancing energetically and your temperature rises even more again.

When your body overheats you lose fluid – some clubbers sweat buckets!

These fluids *must* be replaced!

Drink about one pint of water or a soft drink every hour. Alcohol won't do the job it just dehydrates you even more.

REMEMBER:

....Chill Out....Regular Rest....

Chill Out....Regular Drinks....

Chill Out....
